01

Revenue versus Spend

What is the relationship between these two within the first year?

More spent, more revenue

We can see that as the amount of spending increases, so does the revenue amount.

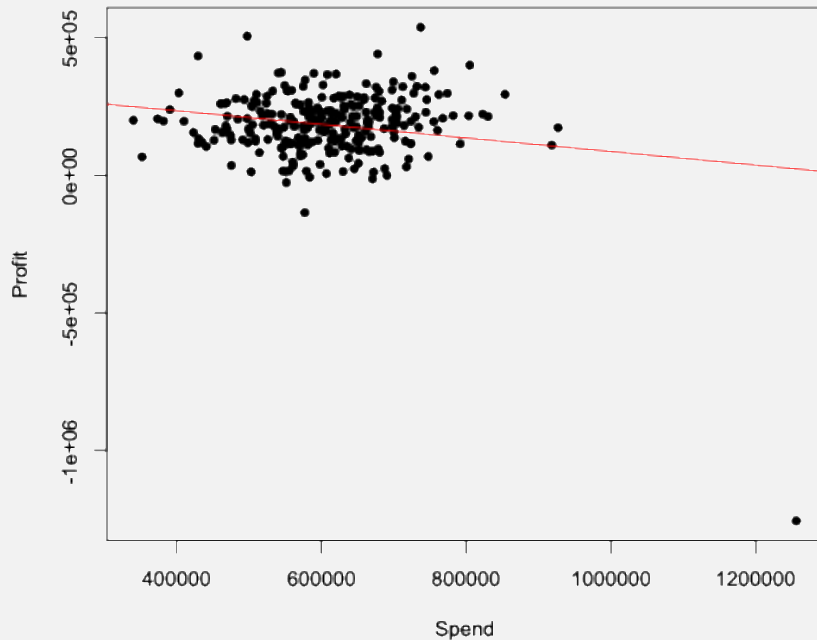

On average, we are profiting about \$0.97 per \$1 spent → losing \$0.03 per \$1

Thus, this shows a positive correlation between spend and revenue: companies that spend more usually make more.

Change the Data

- One company faced a lawsuit from Apple
- Investment addition causing our results to appear slightly negative

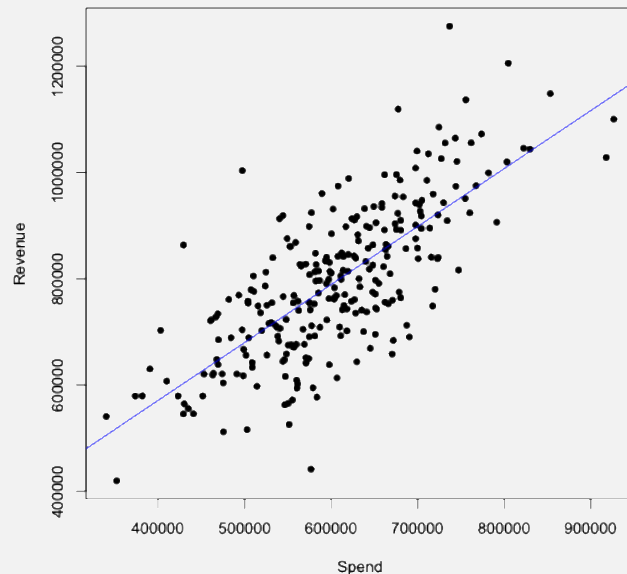

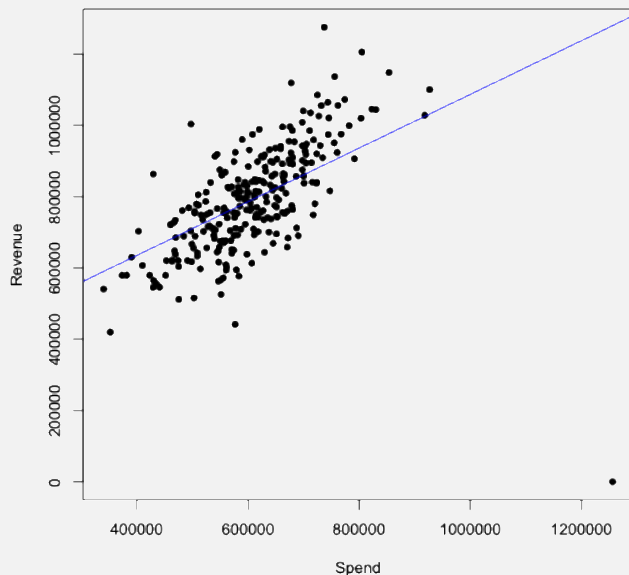

So why don't we remove it?

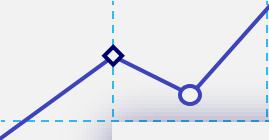

Much Better!!

There we go!

Without company 257, we get a better idea of company profit and revenue

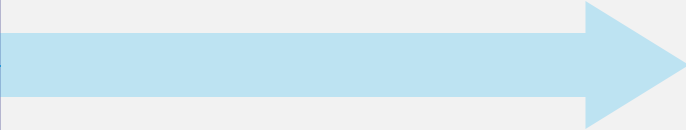

02

Data Collection

We ran a model to estimate the profit based on different levels of investment in our app development.

What would happen with \$500k

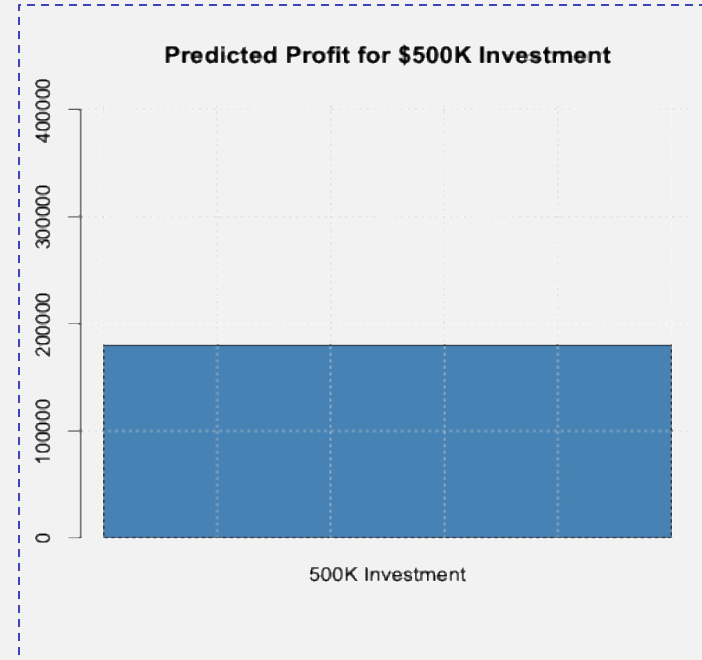

If we invest \$500,000, our model estimates a profit of about \$180,000.

Profit margin:

- Could lose up to \$9,000
- Could profit up to \$370,000

Predicted Revenue: \$ 710,000

Revenue Margins: – lowest of \$648,000
– highest at \$772,000

What would happen with \$700k

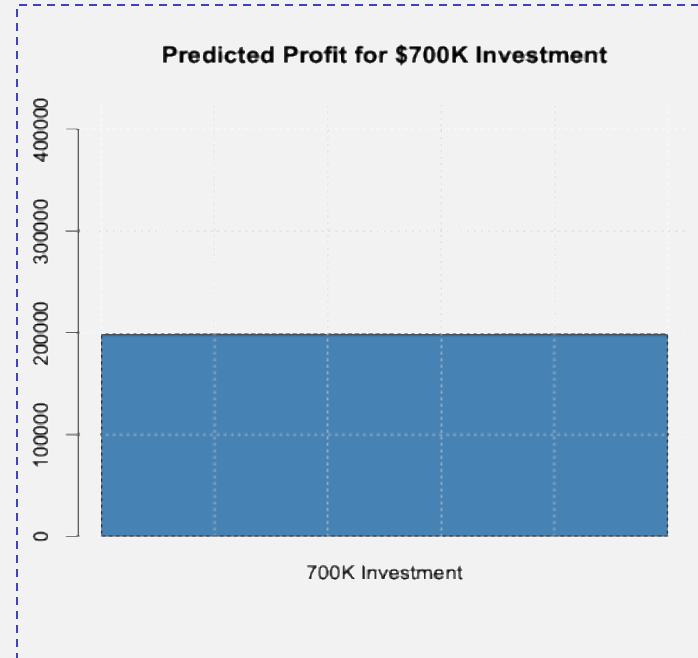

If we invest \$700,000 instead, the estimated profit is expected to rise to \$198,000.

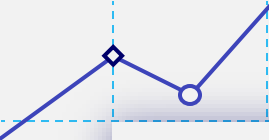

Profit margin:

- Could profit as low as \$ 8,000
- Could profit up to \$ 380,000

Predicted Revenue : \$861,000

Revenue Margins: – lowest of \$786,000
– highest at \$935,000

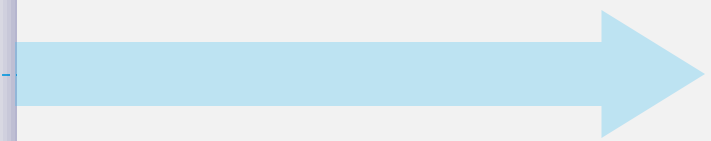

03

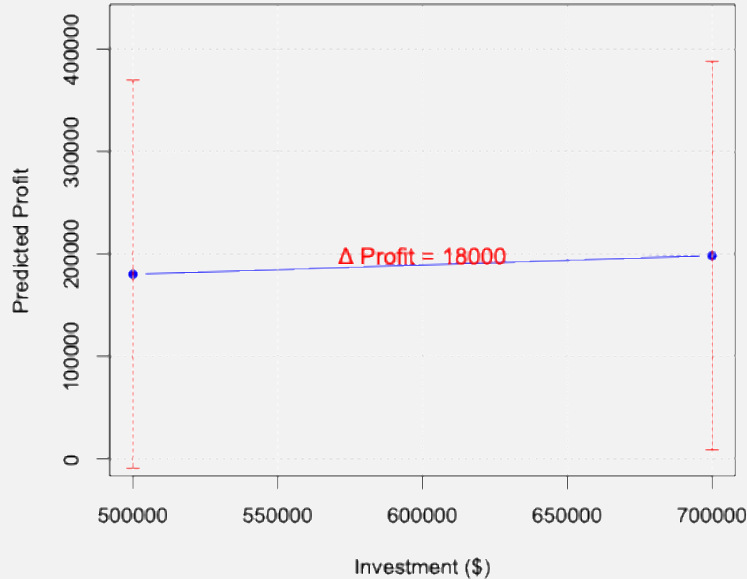

Profit Margins

You can enter a subtitle here if you need it

\$500k v.s. \$700k

Profit Predictions at Different Investment Levels

- Difference in overall profit rates is \$18,000
- Both investments are profitable, but \$500k yields a higher return on investment:
For \$500k investment, every dollar spent returns \$0.42 profit

For 700k investment, every dollar spent returns \$0.23 profit
